RUNS ON NEMOTRON 3 · NEBIUS TOKEN FACTORY

Your standing work, done every morning by a crew that asks before it acts.

Five Nemotron 3 agents plan, research, write, check and learn. The bill is on screen and every send waits for your card.

$0.0216	one real morning, all five agents
24 %	saved by the cost router
0	replies sent without your OK

YOU SET THE GOAL. IT PLANS.

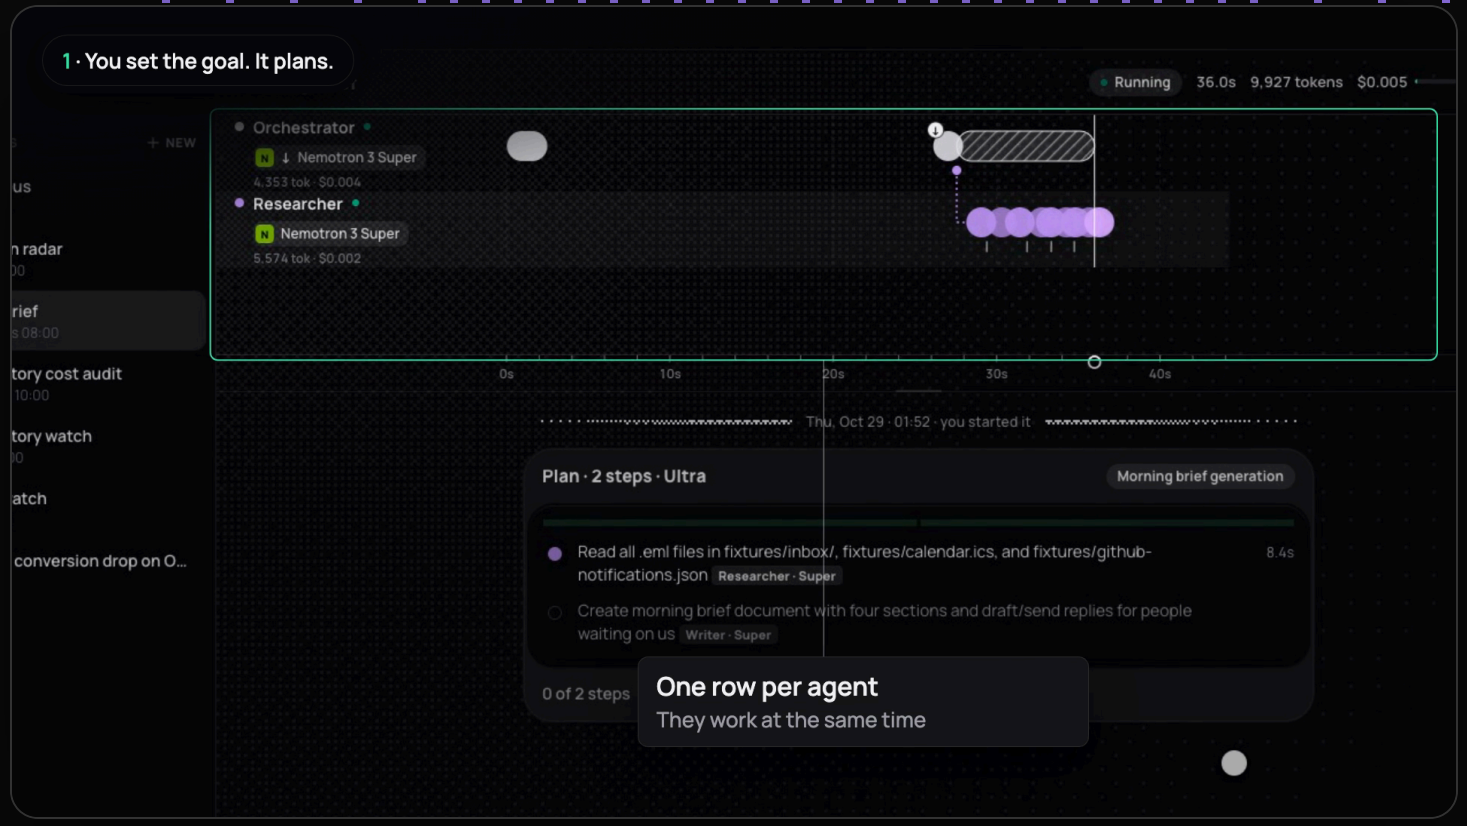

One row per agent. They work at the same time.

The Orchestrator drafts the plan on Ultra. You reword, reorder or approve. Then every agent gets a lane, with its model, its tokens and its cost on the row.

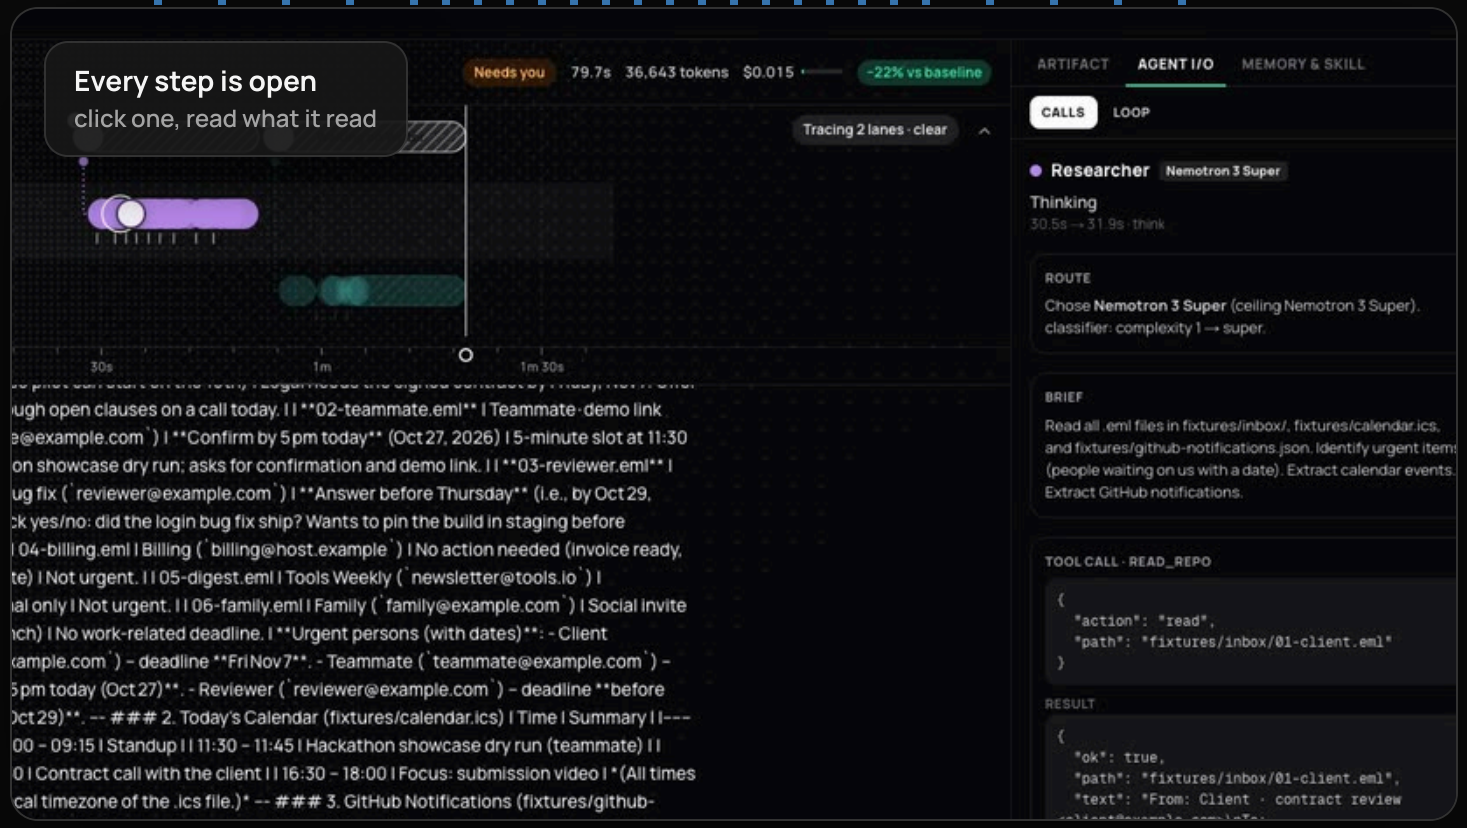

Ultra plans the run and reviews the result

Super researches, analyses, writes

Nano checks the output and writes the memories

Frame from the recorded take of Oct 29, real models

NO SPINNER, NO BUBBLE

Click a segment. Read the route, the brief, the tool call, the result.

Each hop shows which Nemotron size the router chose and why, the exact file it opened, the tokens in and out. Nothing is summarised away.

23	model calls in run one
21	tool calls, every one inspectable
58,950	tokens across the crew

EVERY SIDE EFFECT IS A CARD

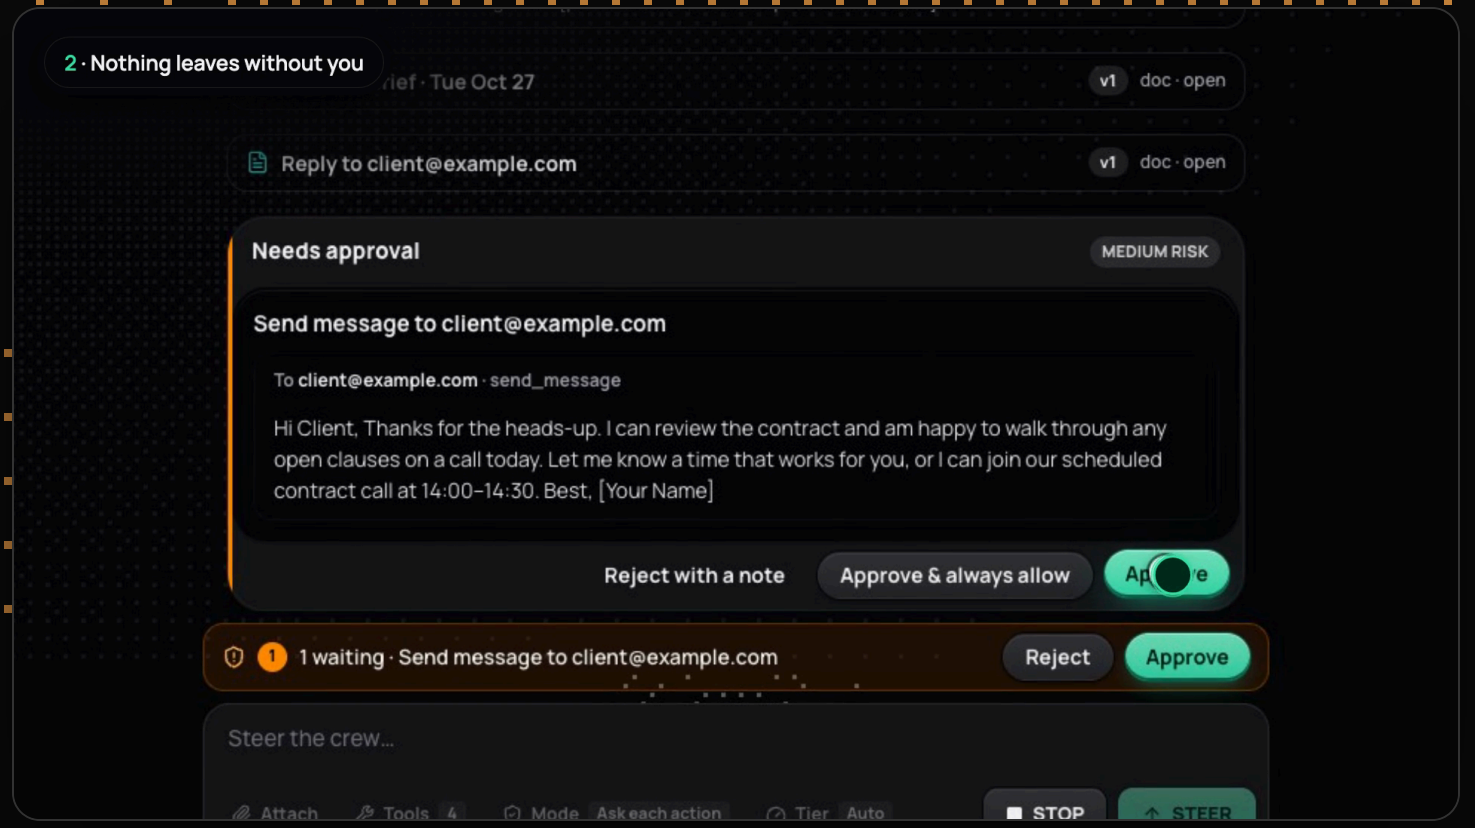

Nothing leaves without you.

A send, a calendar invite, a PR comment: each one stops on a card with the full draft. Approve, reject with a note, or allow it from now on.

3 sends in run one, each approved by you

1 rule saved from "Approve & always allow"

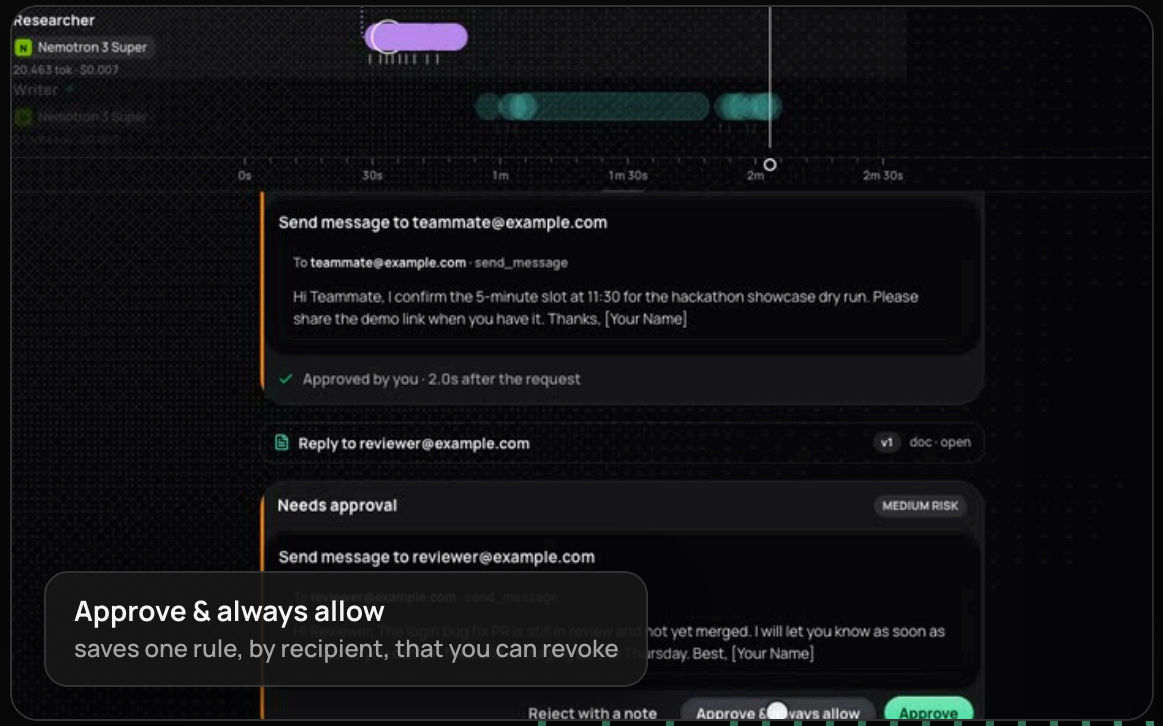

0 sent without a card

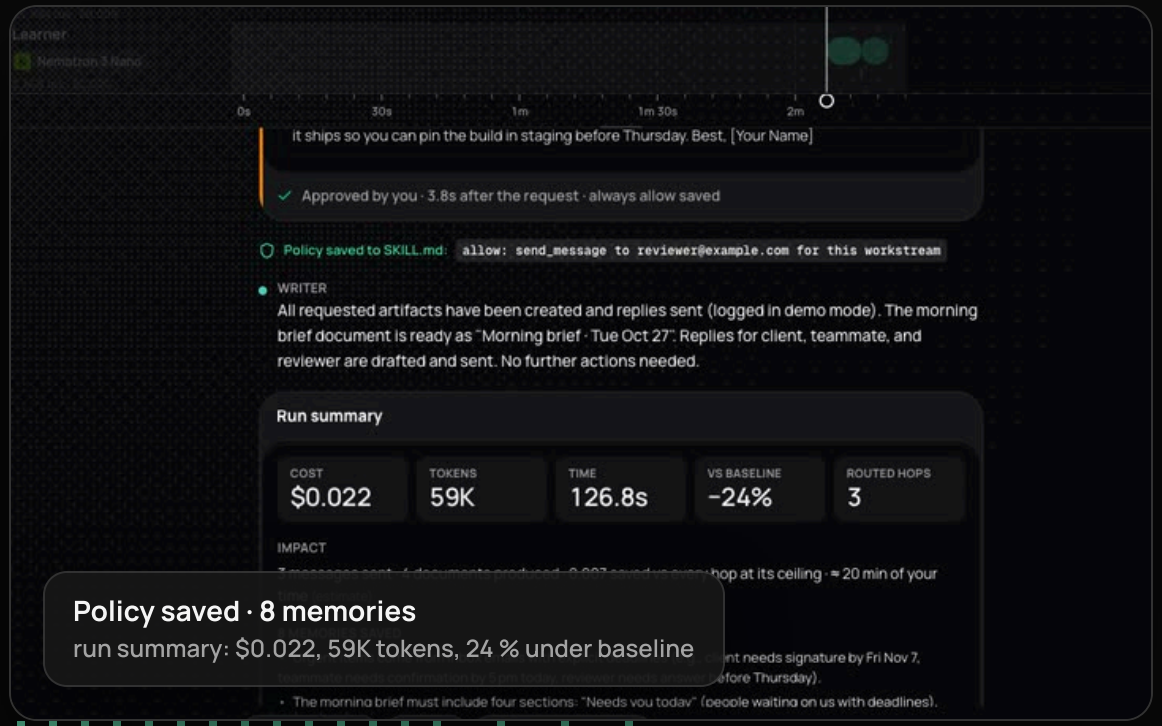

The approval card for the reply to the client, run one

An approval becomes a rule. Then it learns.

The rule is one line in the workstream's SKILL.md, revocable with one click. After the run, Nano writes memories and rewrites the how-to.

Approve & always allow
saves one rule, by recipient, that you can revoke

Policy saved · 8 memories
run summary: $0.022, 59K tokens, 24 % under baseline

RUN TWO STARTS FROM WHAT IT LEARNED

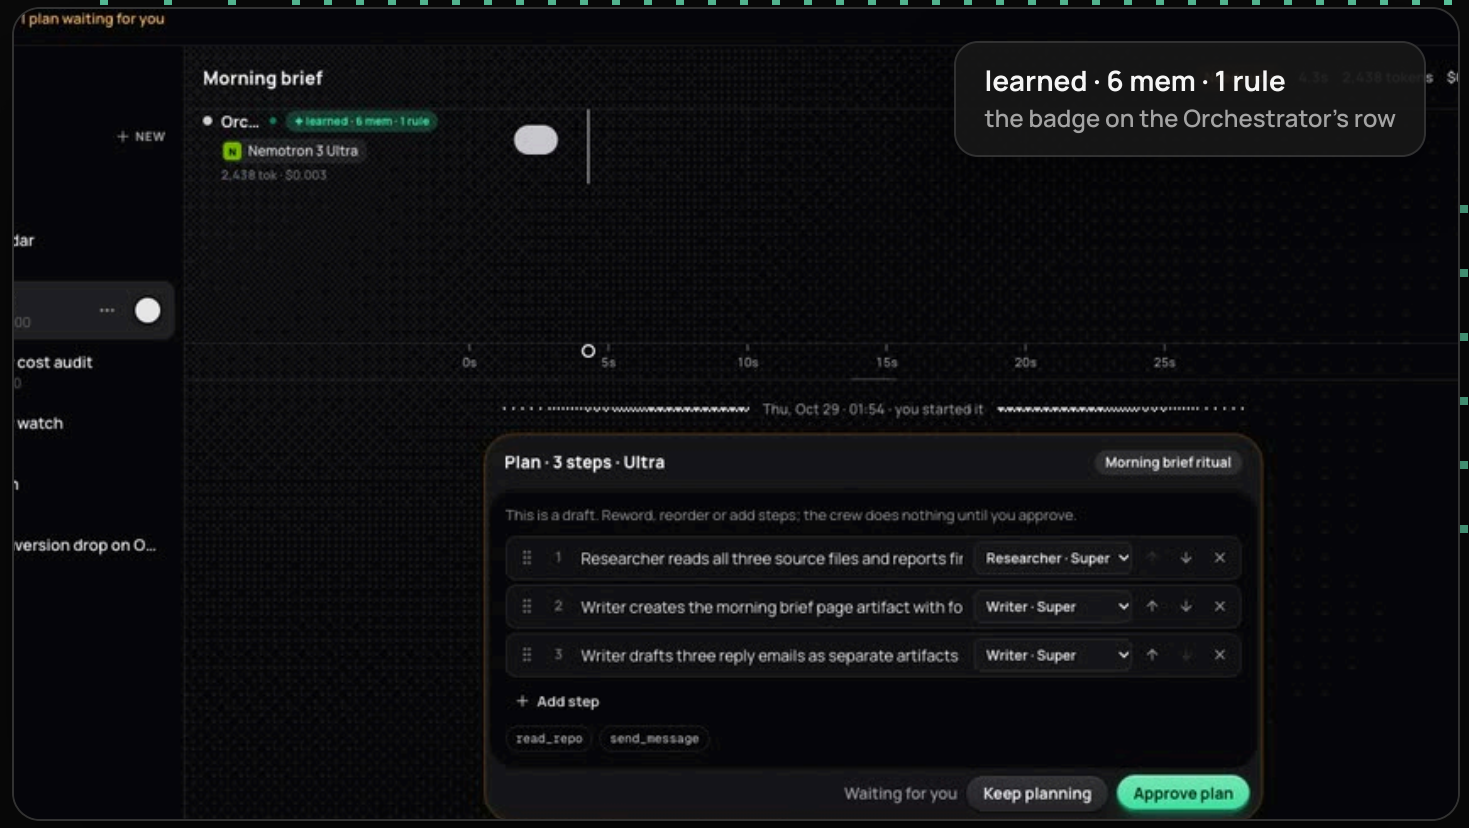

The next morning, cheaper and quieter.

The plan opens with "learned · 6 mem · 1 rule". The reply to the reviewer goes out under the saved rule, with no card. Everything else still asks.

$0.0209 run two, 3 % cheaper than run one

27 % saved by the router

16 memories after two mornings

Run two of the recorded take, real models

THREE SIZES, ONE ENDPOINT

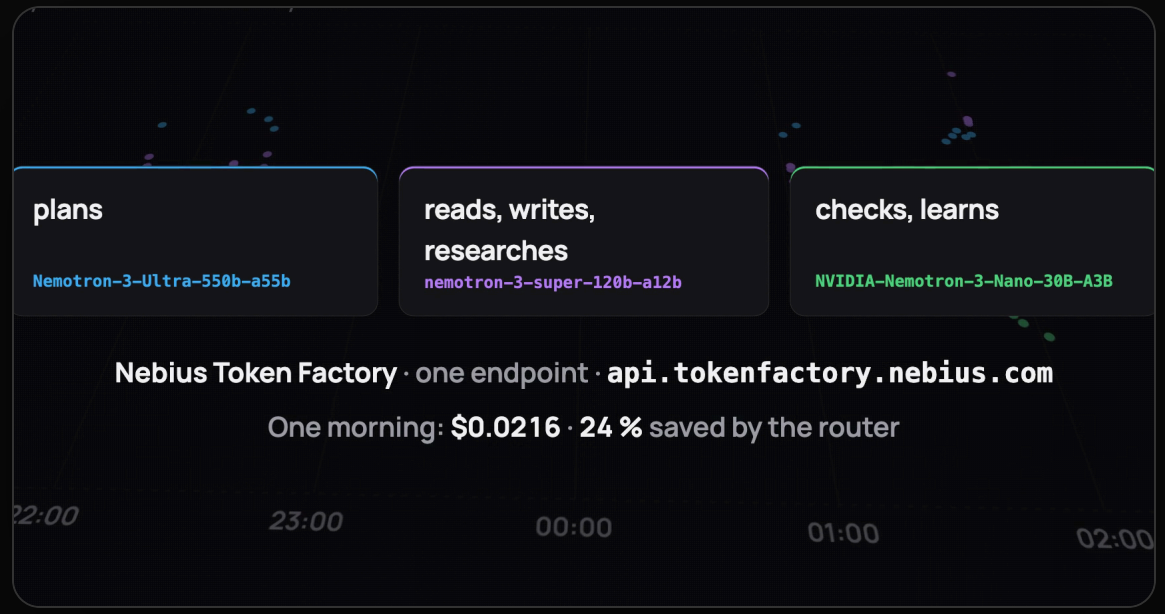

Priced per step. The bill is on screen.

A classifier routes every hop to the cheapest Nemotron that can do it, and shows the saving against sending everything to Ultra. Every call goes to api.tokenfactory.nebius.com.
