Nimbus

Nebius × NVIDIA Global AI Hackathon
Personal AI track · built alone in three days

Your standing work, done every morning by a crew that asks before it acts.

Free and open source. Five Nemotron 3 agents plan, research, write, check and learn through Nebius Token Factory, with the bill on screen and every send behind a card you approve.

One morning, all five agents
$0.0216
The next morning $0.0209: it started from what it learned, 3 % cheaper.

Saved by the cost router
24 %
Against sending every step to the largest model. 27 % the next morning.

Replies sent without your OK
0
3 sends, each behind a card. 1 rule saved, used the next morning with no card.

Tokens, run one
58,950
across all five agents

Model calls
23
plus 21 tool calls, every one open

Memories
16
after two mornings, plus its own how-to

Day cap, live demo
$1
runs stop there, $0.25 per run

WHAT IT DOES

Asks first
Every side effect is a card. An approved one can become a rule, and you can revoke it.

Learns
Memories and a rewritten skill file after every run, so the next one asks less.

Priced per step
Three Nemotron sizes, routed by job, with the bill on screen while it runs.

Yours
Your database, your keys, the tools you list. Nothing runs that you did not allow.

Always on
Schedules in the app, and an OpenAI-compatible endpoint for OpenClaw and Hermes.

Open source
MIT. `pnpm dev` runs it with no keys at all, on a scripted mock model.

HOW IT USES NEMOTRON ON NEBIUS

`nvidia/Nemotron-3-Ultra-550b-a55b`
plans the run, routes each hop and reviews the result (the Orchestrator).

`nvidia/nemotron-3-super-120b-a12b`
does the work: the Researcher, the Analyst and the Writer.

`nvidia/NVIDIA-Nemotron-3-Nano-30B-A3B`
checks the output and writes the memories (the Checker and the Learner).

Every call goes to **`api.tokenfactory.nebius.com`**. Numbers above are measured on the recorded take of Oct 29, 2026, two real runs of the Morning brief, and listed in **`docs/video/RELEASE.md`**.
